

FlaskAssignment .

1. Installed python3 , install flask in mac
2. 1. Create a Flask application with an `/api` route. When this route is accessed, it should return a JSON list. The data should be stored in a backend file, read from it, and sent as a response.
3. Created two file `app.py` and `data.json`

Render the result in browser & screenshot below

The screenshot shows a web browser window with a dark theme. The address bar displays the URL `127.0.0.1:5000/api`. The main content area shows a JSON array of two objects, representing a list of data. The JSON is formatted with syntax highlighting. The top of the browser window shows a tab titled `json.decoder.JSONDecodeError: Expecting value: line 1 column 1 (char 0) // Werkzeug Debugger`.

```
[
  {
    "id": 1,
    "name": "Alice"
  },
  {
    "id": 2,
    "name": "Bob"
  }
]
```

2. Create a form on the frontend that, when submitted, inserts data into MongoDB Atlas. Upon successful submission, the user should be redirected to another page displaying the message **"Data submitted successfully"**. If there's an error during submission, display the error on the same page without redirection.

json.decoder.JSONDecodeError: Expecting value: line 1 column 1 (char 0) // Werkzeug Debugger

1 Submit Data

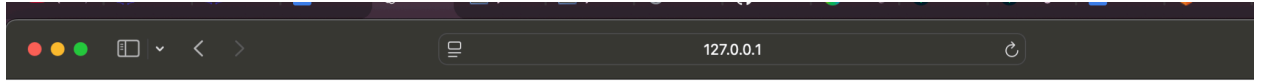

Submit User Data

Name:

Email:

Changing the connection string with username & password.

Entering the value in form

Data submitted successfully
